Acme Security Whitepaper

How Acme protects customer data, October 2026

Encryption

Customer data is encrypted at rest with AES-256 and in transit with TLS 1.2 or higher. Encryption keys are managed in AWS KMS and rotated every 90 days. Strategic customers can bring their own key (BYOK), which they can revoke at any time to make their data unreadable.

Certifications

Acme holds a SOC 2 Type II report covering security, availability and confidentiality, renewed every 12 months. Acme has been ISO/IEC 27001 certified since 2025. Customers can request the latest SOC 2 report under NDA through their account manager.

Backups and Recovery

Production databases are backed up every 6 hours and backups are kept for 35 days. Backups are encrypted and stored in a second availability zone in the same region as the customer data.

Acme's recovery point objective (RPO) is 6 hours and its recovery time objective (RTO) is 4 hours. Disaster recovery is tested twice a year, and the results are summarised in the SOC 2 report.

Testing

An independent firm runs a penetration test of the platform every year. Acme also runs a private bug bounty program and fixes critical findings within 7 days and high findings within 30 days.

Employee Access

Employees sign in with single sign-on and hardware security keys. Access to production systems is granted just in time, expires after 8 hours, and is logged for audit. Access reviews run every quarter.
